

Transmission Line No. 5 Maintenance Projects

The City's transmission lines are part of a regional water supply system that serves about 600,000 people throughout Snohomish County. Their primary function is to carry potable water to City of Everett reservoirs and to deliver water to our customers, from our largest wholesaler to single families. Transmission lines need regular maintenance that requires us to shut off water service to a portion of our customers in the affected area. The City is planning a major valve replacement project in early 2018.

THREE LAKES VALVE PROJECT

Early 2018

The Three Lakes Valve is a pressure-sustaining valve that needs replacement. To do this, the City is working with a contractor to install a new pipe and valve parallel to the Three Lakes Valve. The new system will be connected to the pipeline.

For this project, our isolation valves will be at Clearview Connection (near Bickford Ave) and near Woods Creek – or essentially the entire line east of Bickford Avenue.

The sequence of events to turn off service connections and drain the pipe is similar to the couplings. However, as this project requires two new connections and coordination with a contractor, the process will take longer. Customers should plan to be without water for 48 hours. Affected customers will be notified in advance.

Affected Customers

West of the Clearview Valve (52nd St SE & Bickford Ave)

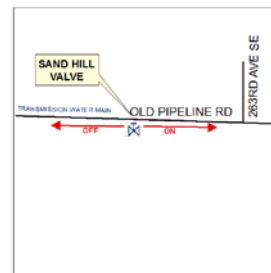

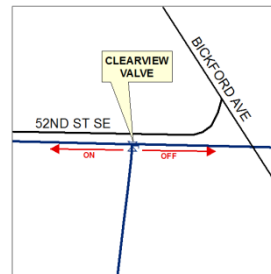

All connections west of this valve will have their services on. Please minimize your water usage during these days.

East of Bickford Ave to the Sand Hill Valve (263rd Ave SE & Old Pipeline Rd)

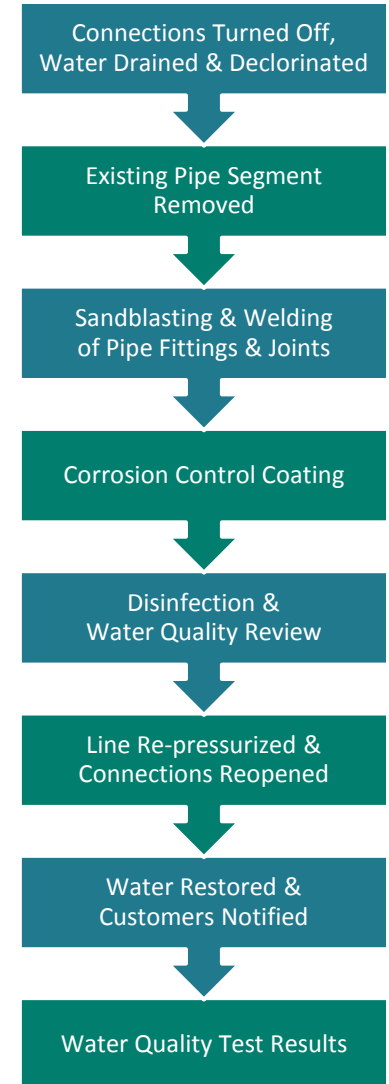

All connections will be shut off.

East of the Sand Hill Valve

All connections will be open, and water use must be kept to a minimum.

Project Process

STAY INFORMED

Make sure you find out about upcoming maintenance projects by keeping your contact information up to date. Call the City of Everett Utility Billing office to update your record at **425-257-8999**.
